Data Structures Practical

Practical – 1
(Poisson Distribution)

Roll No.:S037	Name:Himanshu Manoharlal Shrivastav
Class:SYIT	Batch:01
Date of Assignment:25-06-2026	Date/Time of Submission:25-06-2026

PART – A

Array Operations:

Write a program to implement basic array operations:

a. Insert an element at a specific position in an array.

Code:

```
array=[1,2,3,4,5]
pos=int(input("Enter the Index:"))
ele=int(input("Enter the Element:"))
```

```
array.insert(pos,ele)
print(array)
print("Himanshu S037")
```

Output:

```
=====
Enter the Index:4
Enter the Element:41
[1, 2, 3, 4, 41, 5]
Himanshu S037
```

b. Delete an element from a specific position in an array.

Code:

```
array=[1,2,3,4,5]
pos=int(input("Enter the Index:"))
ele=int(input("Enter the Element:"))
```

```
array.insert(pos,ele)
```

```
print(array)
```

```
eledel=int(input("Enter the element to delete:"))
```

```
array.pop(eledel)
```

```
print(array)
```

```
print("Himanshu S037")
```

Output:

```
Enter the Index:3
Enter the Element:32
[1, 2, 3, 32, 4, 5]
Enter the element to delete:3
[1, 2, 3, 4, 5]
Himanshu S037
```

c. Search for an element in an array (linear search).

Code:

```
array = [1, 2, 3, 4, 5, 6, 7, 8]
```

```
num = int(input("Enter the num: "))
```

```
flag = 1
```

```
for i in array:
```

```
    if i == num:
```

```
        flag = 0
```

```
        break
```

```
if flag == 0:
```

```
    print("Element Found")
```

```
else:
```

```
    print("Element not found")
```

```
print("Himanshu S037")
```

Output:

```
=====
Enter the num: 2
Element Found
Himanshu S037
```
